## Acknowledgements

The Illinois PRAMS program thanks all of the mothers who took the time to participate. The valuable information they provided has contributed to the understanding of why some babies are born healthy and others are not.

Illinois PRAMS thanks the PRAMS team at the U. S. Centers for Disease Control and Prevention for its technical support, review and comments.

This publication was supported by Cooperative Agreement Number UR6 DP000472-05 from the U.S. Centers for Disease Control and Prevention.

## Appendix C. Detailed Tables

## Introduction

The Illinois Pregnancy Risk Assessment Monitoring System (PRAMS) is an ongoing population-based survey of Illinois women who have delivered a live born infant in Illinois. PRAMS is an important part of the Illinois Department of Public Health’s surveillance activities and is part of an initiative by the U.S. Centers for Disease Control and Prevention (CDC) to reduce infant mortality and adverse birth outcomes. The unique information collected by the PRAMS project is used by health professionals, administrators, policy makers and researchers to develop and modify programs and policies to improve the health of women and children in Illinois.

PRAMS collects information from mothers about their behaviors and experiences before, during and immediately following the birth of the baby. The 2008 surveillance report covers a variety of selected topics broken down into several categories: family planning, prenatal care, risk factors, infant care and health, and insurance. Trend data are presented for selected topics within each category. Data are presented graphically in the body of the report with detailed tables containing standard errors and confidence intervals found in Appendix C. Statewide estimates, as well as subgroup analyses by selected sociodemographic categories, are presented. All results are weighted estimates reflective of Illinois resident women who delivered a live birth in Illinois. The data methods used by Illinois PRAMS are standardized CDC protocols used by all participating states (see Appendix A for technical notes).

## Illinois PRAMS FACTS For 2008

## Pregnancy Risk Assessment Monitoring System

## Family Planning

- 41 percent of pregnancies resulting in live births were reported as unintended.
- 49 percent of women who had an unintended pregnancy were not using birth control at the time of conception.

## Prenatal Care

- 81 percent of women reported having heard or read about the importance of taking folic acid to prevent some birth defects.
- 76 percent of women reported being tested for HIV during their pregnancy, while 8 percent did not know if they were tested.
- 41 percent of women went to a dentist or dental clinic during their pregnancy and 44 percent reported being counseled by a dental or other health care worker about care of teeth and gums.
- 86 percent of women reported that a health care worker talked with them about "baby blues" or postpartum depression either during their pregnancy or after delivery.

## Risk Factors

- 3 percent of women reported being physically abused by their husband or partner in the 12 months before their pregnancy; 2 percent reported abuse during pregnancy.
- 3 percent of women reported being physically abused by an ex-husband or ex-partner in the 12 months before pregnancy; 1 percent reported abuse during pregnancy.
- 19 percent of women smoked cigarettes during the three months before they became pregnant, and 10 percent smoked during the last three months of pregnancy.
- 51 percent of women reported drinking alcoholic beverages on a weekly basis in the three months before becoming pregnant. That figure dropped to 6 percent during the last three months of pregnancy. During both time periods, most women reported drinking three or fewer drinks per week.
- 8 percent of women reported being diagnosed with depression after their baby was born.

## Infant Health and Care

- 99 percent of women said they had an infant car seat for their new baby.
- When asked how they learned to install and use the infant car seat, 24 percent of women reported that a health or safety professional showed them. The majority of women (66\%) indicated they learned by reading the instructions that came with the car seat.
- 70 percent of women reported they most often put their baby to sleep on his or her back.
- 78 percent of women reported breastfeeding their baby at least once after birth and 66 percent were still breastfeeding one month after delivery.
- Among mothers who did not breastfeed, the most common reason for not doing so was that they did not like breastfeeding (50\%).

## Section 1

## Family Planning

PRAMS asked women how they felt about the timing of becoming pregnant. Women who indicated that they wanted to be pregnant "then" or "sooner" were classified as having an intended pregnancy (58.7\%). Those who answered that they wanted to be pregnant "later" or "not then or at any time in the future" were considered to have an unintended pregnancy (41.3\%). The Healthy People 2010 Objective (9-1) is to increase intended pregnancies to 70 percent. PRAMS found three out of four unintended births in Illinois were mistimed, meaning that the woman would have preferred being pregnant at a later time. PRAMS also found that 48.7 percent of women who had unintended pregnancies were not using contraception at the time of conception. The Healthy People 2010 Objective (9-3) is to increase the proportion of females at risk of unintended pregnancy (and their partners) who use contraception to 100 percent.

Unintended Pregnancy, 2008
By Selected Maternal Characteristics

When looking at subpopulations of women, the percentage of unintended pregnancies varied widely and was very high among certain groups. Teenagers exhibited the highest percentage of unintended pregnancies when compared to other age groups. Black women had much higher percentages of unintended pregnancies when compared to women of other races. Women with a high school education or less had significantly* more unintended pregnancies when compared to women with more than a high school education. Women whose deliveries were paid for by Medicaid and women who were unmarried had more than double the percentage of unintended pregnancies when compared to women whose deliveries were not paid by Medicaid and married women.
*Statements throughout this report regarding significance refer to statistical significance as determined through the use of confidence intervals. See Appendix A for more details about interpretation of PRAMS data.

The above chart illustrates that during the period of 1998-2008, a decline in unintended pregnancies was not seen in Illinois. The percentage peaked at 46.2 in 2001 and has remained above 40 percent since 1999. Rates among women who were unmarried, young, black, less educated or on Medicaid remained much higher than 40 percent over this time span (see tables 2a and 2b, Appendix C).

## Reasons for Not Using Birth Control

 Among Unintended Pregnancies, 2008

PRAMS asked women why they did not use birth control at conception. A list of reasons was provided and women were asked to check all reasons that applied to their situation. Women who had unintended pregnancies checked most often that either they did not mind if they got pregnant or they thought they could not get pregnant.

## Section 2

## Prenatal Care

The Healthy People 2010 Objective 16-16 is to increase to at least 90 percent the proportion of all pregnant women who receive prenatal care in the first trimester of pregnancy. Among all Illinois women, 81.2 percent reported having their first prenatal care visit during the first trimester of their pregnancies. Some groups of women met the 90 percent objective while others fell far short of it as is illustrated in the chart above. Characteristics of women who met the objective included: more than a high school education and delivery not paid for by Medicaid.

Problems Getting Prenatal Care, 2008

PRAMS provided a list of problems women can have when getting prenatal care and asked women to indicate if they experienced problems with each item. The chart above shows that the top three problems related to not being able to get an appointment when wanted and not having a means of paying for the visit (Medicaid, money or insurance).

# Topics Discussed by Health Care Professionals During Prenatal Care Visits, 2008 

PRAMS provided a list of topic areas that may have been discussed at prenatal care visits and asked women to respond to each item with "yes" if the subject was discussed or "no" if the subject was not discussed. Women were asked not to mark "yes" if only reading materials or a video was provided. At least 75 percent of women indicated that a health care professional had discussed 10 of the 13 topics. The least discussed topic areas included use of seatbelts during pregnancy and intimate partner physical abuse.

Knowledge About Folic Acid, 2008
By Selected Maternal Characteristics

Overall, 81.0 percent of women heard or read that folic acid could prevent some birth defects. However, significant differences were seen among subpopulations of women as highlighted in the chart above. Older or more educated women were more likely to be aware of the benefits of folic acid when compared to younger or less educated women. Black women were less likely to be aware of the benefits when compared with women of other races. Women who were married or whose deliveries were not paid for by Medicaid were more likely to report awareness when compared with unmarried women or women whose deliveries were paid for by Medicaid.

Oral Health Care During Pregnancy, 2008

Maintaining good oral health during pregnancy is important as researchers have found that women with periodontal disease are at an increased risk for delivering preterm low birthweight babies ${ }^{1}$. Pregnant women should see a dentist or dental hygienist during pregnancy for a preventive cleaning ${ }^{2}$. In 2008, 40.9 percent of women in Illinois said they visited a dentist or dental clinic during pregnancy. Nearly 44 percent reported that a health care worker spoke with them about the care of their teeth and gums. Less than onefourth of women said they needed to see the dentist for a problem. (See table 10, appendix C, for more details by sociodemographic factors.)

White and non-Hispanic women were more likely to report going to the dentist during pregnancy when compared with black women and Hispanic women. Women in their mid-20s or older and women with more than a high school education also reported a dental visit more often than younger women and those with a high school education or less. Married women and women whose deliveries were not paid by Medicaid were more likely to have visited the dentist than unmarried women and women whose deliveries were paid for by Medicaid.

A higher percentage of black women reported needing to see the dentist for a problem during pregnancy when compared with white women. Women whose deliveries were paid for by Medicaid were more likely to report needing to see the dentist for a problem when compared with women whose deliveries were not paid for by Medicaid. A higher percentage of women who delivered a low birthweight baby reported seeing the dentist for a problem when compared with women who delivered a normal birthweight baby.

WIC Participation, 2008

PRAMS found that 44.8 percent of women reported participating in the WIC* program during pregnancy, while 52.0 percent participated after delivery. Characteristics of women most likely to participate in the program included being unmarried, young, of black race, of Hispanic ethnicity, or having a high school education or less (see table 11, Appendix C).

## HIV Testing During Pregnancy, 2008

In 2008, 76.0 percent of women indicated they were tested for HIV during pregnancy, 16.0 percent were not tested and 8.0 percent did not know if they were tested.

HIV Testing During Pregnancy, 2008
By Selected Maternal Characteristics

In 2008, black women were significantly more likely to be tested for HIV when compared to women of other races, and unmarried women were more likely to be tested than married women. Women whose deliveries were paid for by Medicaid were more likely to be tested than women whose deliveries were not paid for by Medicaid. Women with less than a high school education were more likely to be tested than women with more than a high school education. When examining age groups, younger women reported higher percentages of testing compared with older women, although the difference was not statistically significant.

*Change in question; see appendix A .

When examining HIV testing during the period of 1998 through 2008, PRAMS found the highest reporting testing rates in more recent years. Until 2004, many significant differences in testing were seen among different groups of women. Starting in 2005, many of the large gaps in testing among different groups of women began closing. Throughout the period, black women were more likely to be tested than women of other races. Unmarried women and women whose deliveries were paid for by Medicaid reported higher testing rates than married women and women whose deliveries were not paid for by Medicaid. In general, younger women reported higher rates of testing than older women (see tables 12a, 12b, 12c, Appendix C).

## Section 3

## Risk Factors

Problems During Pregnancy, 2008

PRAMS asked women if they experienced certain problems during pregnancy by providing a list and asking women to respond "yes" or "no" to each item. From the list provided, the most common problem reported was severe nausea, vomiting or dehydration. The next most common problems reported were kidney/bladder infections, preterm labor (starting more than three weeks before due date), or vaginal bleeding. Fewer than 2 percent of women reported that they had diabetes that started before pregnancy, their cervix was sewn shut, or they were hurt in a car accident. (See table, Appendix C for full list.)

Hospital Visits or Bedrest for Problems During Pregnancy, 2008*

PRAMS asked women if any of the health problems reported during pregnancy resulted in hospital stays or bed rest. Forty-four percent of women reported visiting the emergency room, and about one in five required a hospital stay of up to a week. About 30 percent were advised to have bed rest for more than two days. Less than 5 percent reported staying in the hospital for more than seven days for pregnancy-related problems.
(*Note: Missing response rates for these variables ranged from 12.5 percent to 15.0 percent; interpret with caution.)

## Stressors Prior to Delivery, 2008

High levels of stress during pregnancy can contribute to poor pregnancy outcomes ${ }^{3}$. PRAMS asked about stressful events that occurred during the 12 months prior to delivery and found that nearly 30 percent of women reported experiencing no major stressful events while about 43 percent reported experiencing one to two stressors. Nearly 28 percent reported experiencing three or more stressors.

Types of Stressors Prior to Delivery, 2008

PRAMS provided a list of situations that could cause stress and asked women to indicate if any of the situations happened to them during the 12 months before the baby was born. Overall, the most commonly report event was moving to a new address (29.7\%). About one in four women reported having more arguments with a husband/partner. About one in five women reported having a very sick family member or having a lot of bills that could not be paid.

PRAMS asked women about physical abuse by a current or ex-husband/partner both before and during pregnancy. Nearly 3 percent of women reported abuse by a current or ex-husband/partner before pregnancy, while fewer than 2 percent reported abuse during pregnancy. Regardless of time period or type of partner, unmarried women and women whose deliveries were paid for by Medicaid were more likely to report abuse when compared with married women and those whose deliveries were not paid for by Medicaid (see tables 17 and 18, Appendix C).

Prevalence of Smoking Before, During and After Pregnancy, 2008

Healthy People 2010 Objective 16-17c is to reduce cigarette smoking to a prevalence of no more than 1 percent among pregnant women. In Illinois, PRAMS found that during the three months before pregnancy, 19.2 percent of women reported they were smoking. This decreased to 9.6 percent during the last three months of pregnancy. After delivery, reported smoking climbed to 14.2 percent. Significant differences were seen when comparing different groups of women (see chart on next page).

Prevalence of Smoking
During the Last Three Months of Pregnancy, 2008 By Selected Sociodemographic Characteristics

Women who had given birth to low birthweight babies reported higher percentages of smoking during pregnancy when compared to women who gave birth to normal birthweight babies. Non-Hispanic women were more likely to smoke during all three time periods when compared to Hispanic women. Black and white women were more likely to smoke than women of other races. Women in their early 20s reported higher percentages of smoking during all three time periods when compared to older women. Women with a high school education or less were more likely to smoke during all time periods when compared to women with more than a high school education. Unmarried women and women whose deliveries were paid for by Medicaid reported much higher rates of smoking during all three time periods when compared to married women and women whose deliveries were not paid for by Medicaid. (For more details by sociodemographic characteristics see table 19a, Appendix C).

## Prevalence of Smoking During the Last Three Months of Pregnancy, 1998-2008

With 95 Percent Confidence Intervals

*Change in question; see appendix A.
From 1998 to 2008, there was an overall gradual decline in the percentage of reported smoking during pregnancy. Among age groups, 25- to 34-year-olds exhibited a pattern most consistent with the overall trend in the table above. During the time period, a declining trend was not seen for the 20 - to 24 -year-old group and percentages were variable among teens. Women ages 35 and older reported the lowest percentages from 2004 through 2008. Among races, white women showed a steady pattern of decline, leveling off in 2006. Smoking among black women was more variable throughout the period. Non-Hispanic women exhibited a gradual pattern of decline, with the lowest percentage reported in 2008 (12.3\%). Hispanic women reported low rates of smoking (ranging from $1.7 \%$ to $4.6 \%$ ) throughout the entire period. Women with more than a high school education reported steady rates throughout most of the period, with declines starting in 2006 and the lowest percentage of smoking reported in 2008 (4.5\%). Lesser educated women exhibited more variable patterns throughout the period. Married women showed a steady and significant decline with the lowest percentage report in 2008 (4.6\%), while unmarried women exhibited a more variable pattern.

Gaps remained between groups from 1998 to 2008 with black and white women more likely to smoke than women of other races, and non-Hispanic women more likely to smoke than Hispanic women. Unmarried women and those with a high school education or less were more likely to smoke than married women and those with more than a high school education. Women whose deliveries were paid for by Medicaid were more likely to smoke than women whose deliveries were not paid for by Medicaid (see tables 19a, 19b and 19c, Appendix C).

Healthy People 2010 Objective 16-17a is to increase abstinence from alcohol by pregnant women to at least 94 percent. PRAMS asked women about alcohol use just prior to pregnancy and late into pregnancy. In Illinois, half of women reported drinking in the three months before pregnancy while 6.4 percent reported drinking during the last three months of pregnancy.

Women reported drinking more drinks per week prior to pregnancy when compared with during pregnancy. Among women who reported drinking during pregnancy, nearly 99 percent drank three or fewer drinks per week.

Prevalence of Drinking During the Last Three Months of Pregnancy, 2008 By Selected Sociodemographic Characteristics

*Fewer than six survey respondents indicated they were drinking during pregnancy
PRAMS found that older women were generally more likely to report drinking during pregnancy than younger women. Women with more than a high school education and married women also were more likely to report drinking when compared to women with a high school education or less, and unmarried women. Women whose deliveries were not paid for by Medicaid reported higher percentages of drinking during pregnancy when compared with women whose deliveries were paid for by Medicaid (see table 20, Appendix C).

Postpartum Depression Diagnosis, 2008
By Selected Sociodemographic Characteristics

*Fewer than six respondents indicated they had been diagnosed with depression.

In 2008, the majority (85.6\%) of women reported that a health care worker talked with them either during pregnancy or after delivery about "baby blues" or postpartum depression. After the baby was born, 7.7 percent of new mothers indicated to PRAMS that they had been diagnosed with depression. The above chart illustrates differences in reported diagnosis of depression among different groups of women. Among age groups, women 20- to 24-years old were most likely to report being diagnosed with depression. As the education level of women increased, the likelihood of reporting being diagnosed with depression decreased. Unmarried women reported significantly higher rates of depression diagnosis when compared with married women. A higher percentage of women whose deliveries were paid for by Medicaid reported being diagnosed with depression when compared with women whose deliveries were not paid for by Medicaid. Mothers of low birthweight babies reported a higher percentage of depression diagnoses when compared with mothers of normal birthweight babies.

## Section 4

## Infant Care and Health

Infant Checkups, 2008

PRAMS asked women about infant checkups and found that 92.1 percent of babies were seen within the first week after leaving the hospital and nearly all babies (99.1\%) had a regular health visit at 2 , 4 or 6 months of age. Overall, women were satisfied with the number of checkups their babies had.

Place of Well- baby Checkup, 2008

Women were asked where they usually take their babies for well-baby checkups. About three in five indicated they took their baby to a medical doctor (MD)/Health Maintenance Organization (HM0). One in five took their baby to a hospital clinic. The remaining women took their babies to community health centers, health department clinics, or other places for care.

Healthy People 2010 objective 16-13 is to increase the percentage of healthy full-term babies who are put to sleep on their backs to at least 70 percent. While overall, Illinois met this objective starting in 2006, there are disparities among subpopulations of women. Many groups have not yet met the 70 percent objective. These women were more likely to be young, not married, of black race, and of Hispanic ethnicity. They also were more likely to have a high school education or less, and the delivery paid for by Medicaid (see chart on the next page).

PRAMS found generally that older women were more likely to put their babies to sleep on their backs when compared with younger women. Non-black women also were more likely to put babies to sleep on their backs when compared to black women. Non Hispanic women were more likely to use the back sleep position than Hispanic women. Women with more than a high school education were more likely to put their babies to sleep on their backs when compared to less educated women. Women who were married and whose deliveries were not paid for by Medicaid were more likely to put their babies to sleep on their backs when compared to women who were not married and whose deliveries were paid for by Medicaid.

## Prevalence of Laying Infant on Back to Sleep, 1998-2008 <br> With 95 Percent Confidence Intervals

*Change in question; see Appendix A

From 1998 to 2008, there was a significant increase in the prevalence of laying infants to sleep on their backs. While most subpopulations of women reported increases in putting infants to sleep on their backs during this time period, gaps remained between groups. Older and more educated women reported higher percentages than younger, less educated women. Non-black women continued to report higher percentages than black women. Women who were married or whose deliveries were not paid for by Medicaid reported higher percentages of laying infants down to sleep on their backs than women who were not married or whose deliveries were paid for by Medicaid. From 2005 through 2007, significant differences were not seen when comparing Hispanic with non-Hispanic ethnicity, or when comparing low versus normal birthweight groups. In 2008, however, Hispanic women were again significantly less likely than non-Hispanic women to put their babies to sleep on their backs (see tables 26a, 26b, and 26c, Appendix C).

## Breastfeeding Initiation and Continuation, 2008

PRAMS found that 77.8 percent of women reported breastfeeding their babies at least once after birth, while 65.8 percent of women were still breastfeeding at one month after delivery.

Breastfeeding Initiation, 2008 By Selected Sociodemographic Characteristics

When examining subpopulations of women, many significant differences existed in breastfeeding initiation. Older women and those with more than a high school education had higher initiation rates than younger, less educated women. Non-black and Hispanic women were significantly more likely to breastfeed than black or non-Hispanic women. Women who were married or whose deliveries were not paid for by Medicaid had significantly higher rates of initiation when compared with unmarried women or those whose deliveries were paid for by Medicaid. Similar patterns could be seen with continuation at one month (see tables 27 and 28, Appendix C).

*Change in questions; see appendix A .
From 1998-2008, breastfeeding initiation and continuation at one month followed similar patterns, peaking in 2008. Throughout the period, gaps remained among groups. Older women and those with more than a high school education were more likely to initiate and continue breastfeeding than their younger, less educated counterparts. Non-black and Hispanic women were significantly more likely to breastfeed than black or non-Hispanic women. Married women and women whose deliveries were not paid for by Medicaid were more likely to initiate and continue breastfeeding when compared to unmarried women or those whose deliveries were paid for by Medicaid.

## Reasons for Not Breastfeeding, 2008

PRAMS provided a list of reasons why women might not initiate breastfeeding and asked women to check all of the reasons that applied to them. The most common reason checked for not breastfeeding was they did not like breastfeeding (49.9\%). One in five women cited returning to work or school as barrier.

How Did You Learn to Install and Use
Your Infant Car Seat? (2008)

PRAMS asked women if they had an infant car seat for their new baby and nearly all women (99.2\%) said "yes." This figure did not vary significantly across subpopulations of women. Women were then given a list and asked to check all of the ways they learned to install and use the car seat. PRAMS found that the majority (66.4\%) reported reading the instructions.

## Section 5

## Insurance

Source of Payment for Prenatal Care and Delivery, 2008

PRAMS asked women how their prenatal care and deliveries were paid. For prenatal care, about 49 percent of women reported using Medicaid while about 52 percent indicated they used private health insurance or an HMO. For payment of delivery, about 52 percent of women reported using Medicaid while about 49 percent of women reported using private health insurance or an HMO. Nearly 20 percent of women reported using personal income as well to pay for the prenatal care and delivery.
(Note: Percentages do not add up to 100 as more than one type of payment could have been chosen.)

Type of Insurance for Baby, 2008

PRAMS asked women if they had health insurance or Medicaid for their new baby and found that 97.4 percent indicated they had some type of coverage. The above chart shows the type of coverage women had for their new baby. Nearly 46 percent were covered either by private health insurance/HMO or Medicaid. KidCare or CHIP was indicated as the insurance type by 8.4 percent of women. (Note: Percentages may not add up to 100 as more than one type of insurance could have been chosen.)

[^0]
## Appendix A <br> Technical Notes

## Collection of Data

The data collection for the 2008 Illinois Pregnancy Risk Assessment Monitoring System (PRAMS) was conducted by the Illinois Center for Health Statistics, Illinois Department of Public Health.

Illinois uses the standardized data collection methods developed by the U.S. Centers for Disease Control and Prevention (CDC) and used by all states participating in PRAMS. Data are collected through mailed surveys with telephone follow-up for non-responders. A systematic stratified random sample of approximately 200 mothers is selected monthly from a frame of eligible birth certificates. At two to six months after delivery, each sampled mother is mailed an introductory letter followed up by a 14-page survey. A reminder letter and a second and third mailing of the survey are sent to those who do not respond. PRAMS interviewers telephone mothers who do not respond to any of the mailed surveys to administer the survey by telephone. Surveys are available in both English and Spanish, and telephone interviews were conducted in both languages.

A total of 2,341 women were eligible to participate in the study in 2008; 1,685 women actually participated. Sample numbers, response rates and weighted estimates by selected characteristics are presented in Appendix B.

## Sampling Design

A systematic stratified random sampling design is used to oversample low birthweight (<2,500 grams) births. The sample is divided into two strata: low birthweight (less than 2,500 grams) and normal birthweight (2,500 grams or greater). The weighted response rates in 2008 were as follows:

Overall, 72.8 percent
Low birthweight, 68.5 percent
Normal birthweight, 73.2 percent

## Weighting and Interpretation of Results

Statistics in this report are based on weighted data. The weights were developed by CDC to adjust for sample design, non-response patterns and omissions from the sampling frame. The final sampling weight used in the analysis of the survey data is the product of these three elements. Weighting is necessary to give unbiased estimates of population parameters.

Percentages, standard errors and the 95 percent confidence intervals were calculated using SUDAAN software. Confidence intervals were used to determine significance of trends. All missing observations were excluded. Missing values equal to or exceeding 10 percent are noted. Estimates for subpopulations in which there were fewer than 32 respondents are not reported, as they may be imprecise and biased. Estimates for response categories with fewer than six respondents are not reported, as they may be unstable.

PRAMS data are representative of Illinois resident women, age 14 years or older, who have given live birth in Illinois. The data are not applicable to all pregnant women. Women younger than 18 years of age were not asked questions about physical abuse.

Periodically, the PRAMS survey undergoes a major revision during which questions may be modified, dropped or new questions added. Such revisions occurred in the years 2000 and 2004. Changes associated with each survey phase are noted throughout this document when multiyear data are presented. Specific wording changes are presented below:

## HIV Testing

Phase 3 and 4 Question (1998-2003)
At any time during your most recent pregnancy or delivery, did you have blood test for HIV (the virus that causes AIDS)?

No
Yes
I don't know
Phase 5 Question (2004-2008)
At any time during your most recent pregnancy or delivery, did you have a test for HIV (the virus that causes AIDS)?

No
Yes
I don't know

## Smoking During Pregnancy

Phase 3 and 4 Question (1998-2003)
In the last three months of your pregnancy, how many cigarettes or packs of cigarettes did you smoke on an average day? (A pack has 20 cigarettes.)

$$
\text { _Cigarettes } \mathbf{O R}_{\ldots} \quad \text { Packs }
$$

Less than 1 cigarette a day
I didn't smoke
I don't know

Phase 5 Question (2004-2008)
In the last three months of your pregnancy, how many cigarettes did you smoke on an average day? (A pack has 20 cigarettes.)

41 cigarettes or more
21 to 40 cigarettes
11 to 20 cigarettes
6 to 10 cigarettes
1 to 5 cigarettes
Less than 1 cigarette
None (0 cigarettes)

## Breastfeeding Initiation and Duration

Phase 3 Question (1998, 1999):
For how many weeks did you breastfeed your new baby?
$\qquad$ Weeks
I didn't breastfeed my baby
I breastfed less than one week
I'm still breastfeeding
Phase 4 and 5 Questions (2000-2008):
Did you ever breastfeed or pump breast milk to feed your new baby after delivery?
No
Yes

How many weeks or months did you breastfeed or pump milk to feed your baby?
$\qquad$ Weeks OR $\qquad$ Months
Less than 1 week

## Infant Sleep Position

Phase 3 Question (1998, 1999):
How do you put your new baby down to sleep most of the time? Check one answer.
On his or her side
On his or her back
On his or her stomach
Phase 4 and 5 Question (2000-2008):
How do you most often lay your baby down to sleep now? Check one answer.
On his or her side
On his or her back
On his or her stomach

## Appendix B

Sample Numbers, Response Rates and Weighted Estimates by Selected Characteristics
Illinois PRAMS, 2008

| Characteristic | Number Sampled | Number of Respondents | Unweighted Percent Responding | Weighted Estimate* |
| :---: | :---: | :---: | :---: | :---: |
| All | 2,341 | 1,685 | 72.0 | 168,649 |
| Age |  |  |  |  |
| < 20 years | 280 | 189 | 67.5 | 18,891 |
